

## **THE PROBLEM:**

Water passes through seawall cracks or under seawalls, removing ground soil as it exits. This process creates a void that will eventually cause settlement of the land and structural problems.

## **THE SOLUTION:**

Polyurethane injection fills in the void and seals the cracks.

**Structure and land in danger of collapse**

**Deadman Tieback securing seawall.**  
As soils weaken, collapse is imminent.

**Hidden cavity growing under structure and along wall.**

**High Tide**

**Low Tide**

**Ground soil escaping from cracks, joints, and under wall.**

**StableSoils**
