

Getting Started

While easy to use, just like a bicycle, riding one can take some getting used to. One should be able to ride with confidence within a few minutes.

First off, if you're a beginner, or it has been years since you've been on one, eCarve LLC has an open area adjacent to our store, and a open parking lot directly behind Get Outside to practice before you head out on your adventure.

This is considerably a large area with no traffic and obstacles.

Basic Steps

- To ride, flip the latch located at the base of the steering column and unlock your scooter, raising it in a full, upright position.
- Power up your scooter by pressing the on switch. If your scooter comes equipped with an LED display, take a look at the information, especially the battery life indicator.
- On the handlebars you'll find the handbrake. Most scooter brakes are pretty sensitive, so go easy on it until you become more familiar with your new scooter.
- The throttle is what you'll use to increase or reduce the power. To get started hit the throttle and you're off.
- Once you're ready to stop, use the hand or foot brake. If you've reached your destination, make sure you remember to power the scooter off.
- Next, fold the scooter back up, engage the latch, and you're done.

Safety

No matter who you're with, where you're riding, or who you are, always wear a helmet. You should protect your head at all times.

Clothing

Aside from head gear, you should also wear protective clothing. The clothing should cover your arms and legs, so you'll have a little protection in the event of a fall. For kids and beginners, we recommend wearing knee and elbow pads.

In the Event of an Accident

If you're about to fall, remember not to panic. Whatever you do, don't grab the throttle. This will only cause the situation to go from bad to worse.

Instead, simply let go of everything and jump away from the scooter. Don't try to protect the scooter. Focus on getting away from the danger.
